

Convex Optimization

Prof. Nati Srebro

Lecture 10:
Generalized Inequalities
Multiple Objectives

Reading: Boyd and Vandenberghe Sections 2.4,2.6,3.6,4.6—4.7,5.9

Matrix Inequalities (Semi Definite Constraints)

$$\begin{array}{ll} \min_{\mathbf{x} \in \mathbb{R}^n} & f_0(\mathbf{x}) \\ s.t. & f_i(\mathbf{x}) \leq 0 \\ & h_i(\mathbf{x}) = 0 \end{array}$$

$f_0: \mathbb{R}^n \rightarrow \mathbb{R}$ convex

$f_i: \mathbb{R}^n \rightarrow S^{k_i} \subset \mathbb{R}^{k_i \times k_i}$ **matrix-convex:**

$$f_i(\theta x + (1 - \theta)x') \leq \theta f_i(x) + (1 - \theta)f_i(x')$$

$h_i: \mathbb{R}^n \rightarrow \mathbb{R}$ linear (or $\rightarrow S^k$, doesn't matter much)

Sometimes convenient to represent $x \in S^n$: doesn't matter much,
its just a vector space of dimensionality $n(n + 1)/2$

Semi-Definite Programming (SDP): f_0, f_i linear

Duality with Matrix Inequalities

$$\begin{array}{ll} \min_{\boldsymbol{x} \in \mathbb{R}^n} & f_0(\boldsymbol{x}) \\ \text{s.t.} & f_i(\boldsymbol{x}) \leq 0 \quad \lambda_i \in S^{k_i} \\ & h_i(\boldsymbol{x}) = 0 \quad v_i \in \mathbb{R} \end{array}$$

$$\begin{array}{ll} \max_{\boldsymbol{\lambda}_i \in S^{k_i}, \boldsymbol{v} \in \mathbb{R}^p} & g(\boldsymbol{\lambda}, \boldsymbol{v}) \\ \text{s.t.} & \lambda_i \geq 0 \end{array}$$

$f_0: \mathbb{R}^n \rightarrow \mathbb{R} \cup \{\infty\}$ convex, $f_i: \mathbb{R}^n \rightarrow S^{k_i}$ matrix convex, $h_j: \mathbb{R}^n \rightarrow \mathbb{R}$ linear

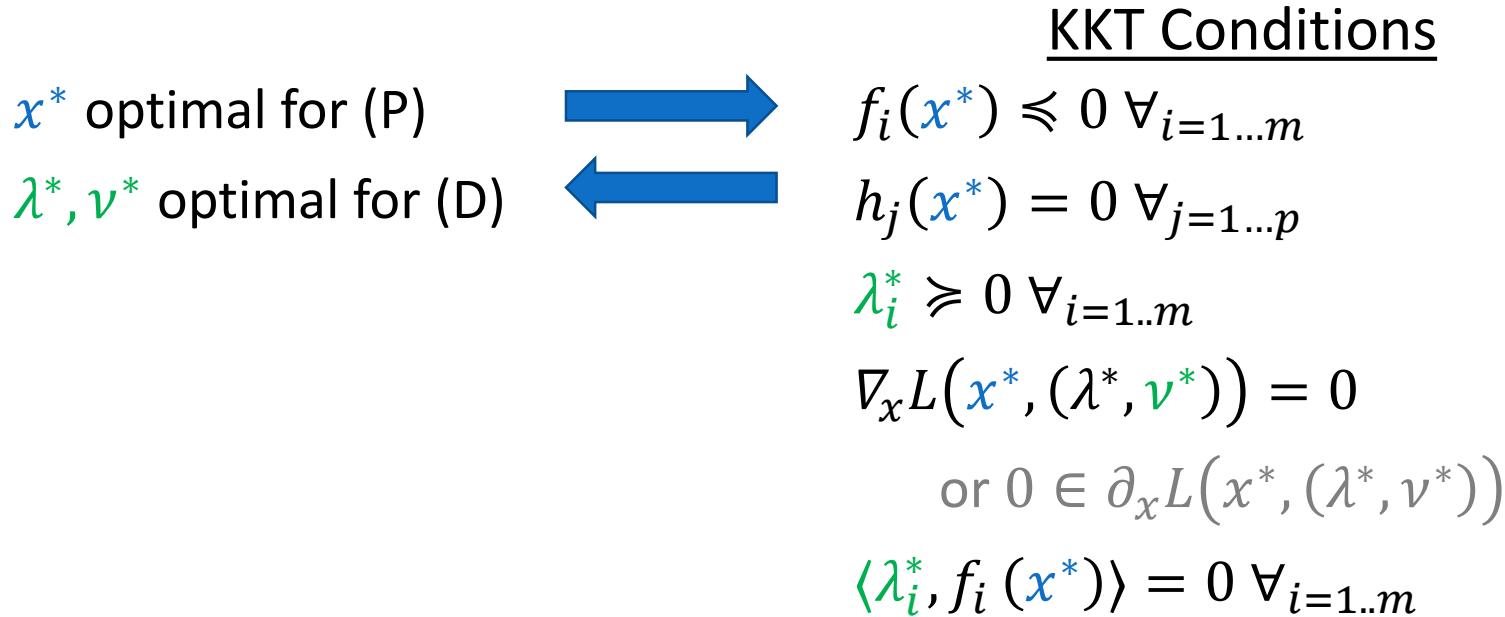

$$L(\boldsymbol{x}, (\boldsymbol{\lambda}, \boldsymbol{v})) = f_0(\boldsymbol{x}) + \sum_{i=1}^m \langle \boldsymbol{\lambda}_i, f_i(\boldsymbol{x}) \rangle + \sum_{j=1}^p v_j h_j(\boldsymbol{x})$$

$$p^* = \inf_{\boldsymbol{x}} \sup_{\boldsymbol{\lambda}_i \geq 0, \boldsymbol{v}} L(\boldsymbol{x}, (\boldsymbol{\lambda}, \boldsymbol{v})) \geq \sup_{\boldsymbol{\lambda}_i \geq 0, \boldsymbol{v}} \inf_{\boldsymbol{x}} L(\boldsymbol{x}, (\boldsymbol{\lambda}, \boldsymbol{v})) = d^*$$

$$g(\boldsymbol{\lambda}, \boldsymbol{v}) = \inf_{\boldsymbol{x}} L(\boldsymbol{x}, (\boldsymbol{\lambda}, \boldsymbol{v}))$$

Slater (\exists feasible x s.t. $f_i(x) < 0$) \rightarrow Strong duality

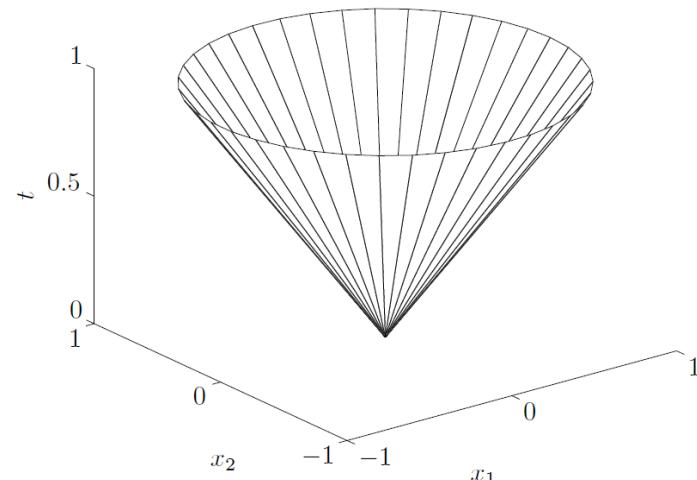

Optimality Condition (assuming Strong Duality)

x^* optimal for (P) $\Leftrightarrow \exists \lambda^*, \nu^*$ s.t. x^*, λ^*, ν^* satisfy KKT

Generalized Inequalities

- More generally: $f_i: \mathbb{R}^n \rightarrow \mathbb{R}^{k_i}$ with the constraint $-f_i(x) \in K_i$ where $K_i \subset \mathbb{R}^{k_i}$ is a **closed pointed convex cone** with non-empty interior (“proper cone”)
 - Cone: $x \in K, \theta > 0 \rightarrow \theta x \in K$
 - Pointed: $x \in K, x \neq 0 \rightarrow -x \notin K$
- Examples:
 - $K = \mathbb{R}_+$: scalar non-negativity constraints
 - $K = \mathbb{R}_+^k$ (positive orthant): elementwise non-negativity
 - $K = S_+^k = \{X \in S^k | X \geq 0\}$: semi-definite constraint
 - $K = \{[x \ t], x \in \mathbb{R}^{k-1}, t \in \mathbb{R} \mid \|x\| \leq t\}$ (norm cone)

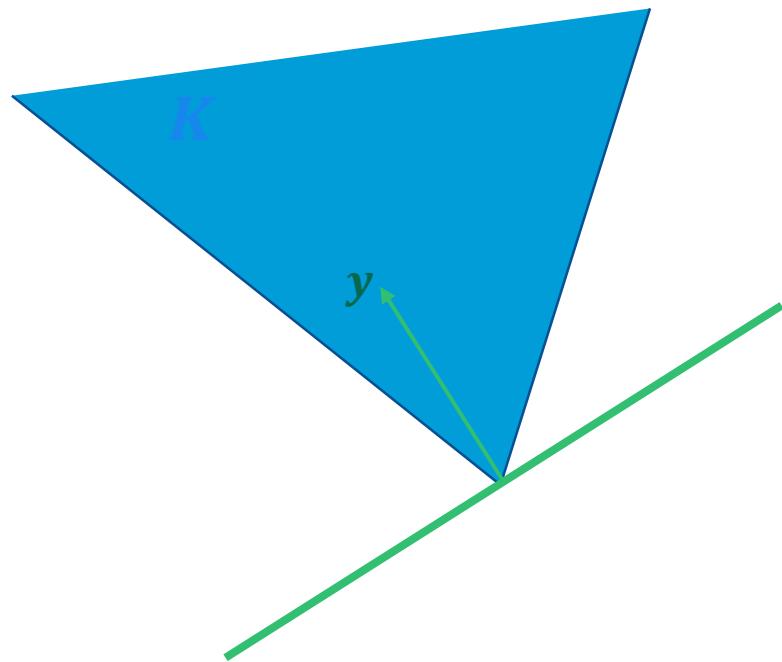

Generalized Inequalities

- More generally: $f_i: \mathbb{R}^n \rightarrow \mathbb{R}^{k_i}$ with the constraint $-f_i(x) \in K_i$ where $K_i \subset \mathbb{R}^{k_i}$ is a **closed pointed convex cone** with non-empty interior (“proper cone”)
 - Cone: $x \in K, \theta > 0 \rightarrow \theta x \in K$
 - Pointed: $x \in K, x \neq 0 \rightarrow -x \notin K$
- Examples:
 - $K = \mathbb{R}_+$: scalar non-negativity constraints
 - $K = \mathbb{R}_+^k$ (positive orthant): elementwise non-negativity
 - $K = S_+^k = \{X \in S^k | X \geq 0\}$: semi-definite constraint
 - $K = \{[x \ t], x \in \mathbb{R}^{k-1}, t \in \mathbb{R} \mid \|x\| \leq t\}$ (norm cone)
- Notation: $x \leq_K y$ means $y - x \in K$
 - Constraint: $f_i(x) \leq_K 0$
- K -convexity: $f(\theta x + (1 - \theta)x') \leq_K \theta f(x) + (1 - \theta)f(x')$

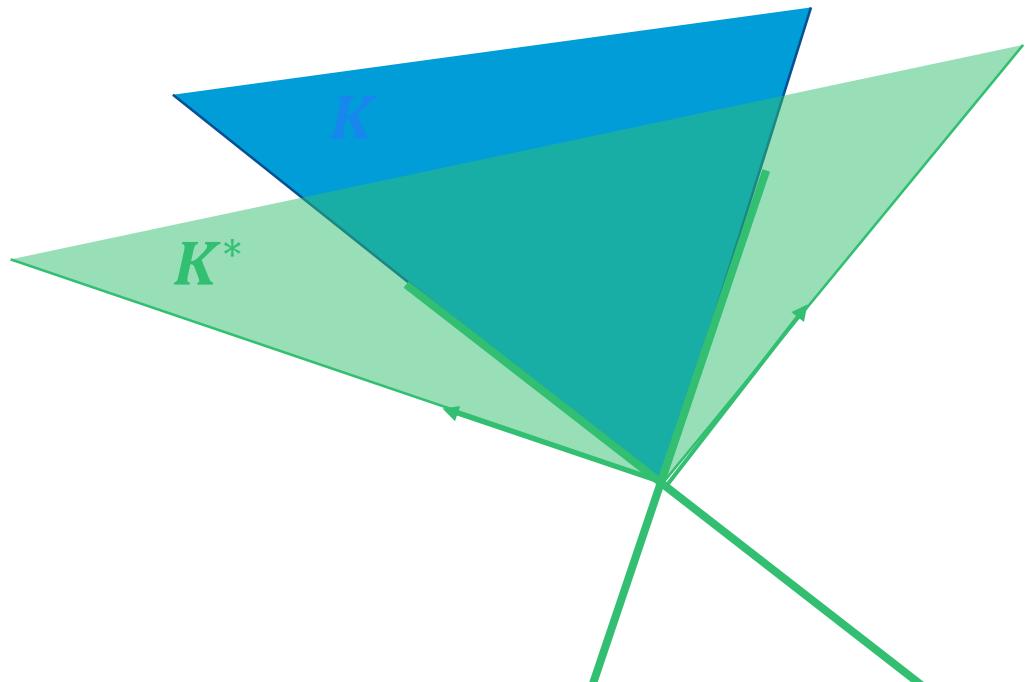

Dual Cone

$$K^* = \{ \textcolor{green}{y} \in (\mathbb{R}^k)^* \mid \forall_{(\textcolor{blue}{x} \in K)} \langle \textcolor{green}{y}, \textcolor{blue}{x} \rangle \geq 0 \}$$

Dual Cone

$$K^* = \{\textcolor{violet}{y} \in (\mathbb{R}^k)^* \mid \forall_{(\textcolor{blue}{x} \in K)} \langle \textcolor{violet}{y}, \textcolor{blue}{x} \rangle \geq 0\}$$

Dual Cone

$$K^* = \{ \textcolor{green}{y} \in (\mathbb{R}^k)^* \mid \forall_{(\textcolor{blue}{x} \in K)} \langle \textcolor{green}{y}, \textcolor{blue}{x} \rangle \geq 0 \}$$

- $(\mathbb{R}_+^k)^* = \mathbb{R}_+^k$
- $(S_+^k)^* = S_+^k$
- $\{ [x \ t], x \in \mathbb{R}^{k-1}, t \in \mathbb{R} \mid \|x\| \leq t \}^*$
 $= \{ [y \ s], y \in \mathbb{R}^{k-1}, s \in \mathbb{R} \mid \|y\|_* \leq s \}$

Generalized Inequality Constraints

$$\begin{array}{ll}\min_{\boldsymbol{x} \in \mathbb{R}^n} & f_0(\boldsymbol{x}) \\ s.t. & f_i(\boldsymbol{x}) \leq_{K_i} 0 \\ & h_i(\boldsymbol{x}) = 0\end{array}$$

$f_0: \mathbb{R}^n \rightarrow \mathbb{R} \cup \{\infty\}$ convex

$f_i: \mathbb{R}^n \rightarrow \mathbb{R}^{k_i}$ K_i -convex

$h_j: \mathbb{R}^n \rightarrow \mathbb{R}$ linear

Can always combined to single conic constraint:

$$\tilde{f}(\boldsymbol{x}) = [f_1(\boldsymbol{x}); f_2(\boldsymbol{x}); \dots; f_m(\boldsymbol{x})] \leq_K 0$$

$$\tilde{f}(\boldsymbol{x}): \mathbb{R}^n \rightarrow \mathbb{R}^k \quad k = \sum_i k_i$$

$$K = K_1 \times K_2 \times \dots \times K_m$$

Cone Programs: Generalized Linear Inequalities

$$\begin{aligned} & \min_{\mathbf{x} \in \mathbb{R}^n} c^\top \mathbf{x} \\ \text{s.t. } & G\mathbf{x} \leq_K h \\ & A\mathbf{x} = b \end{aligned}$$

Inequality form:

$$\begin{aligned} & \min_{\mathbf{x} \in \mathbb{R}^n} c^\top \mathbf{x} \\ \text{s.t. } & \tilde{G}\mathbf{x} \leq_{\tilde{K}} \tilde{h} \end{aligned}$$

$$\begin{aligned} & G\mathbf{x} \leq_K h \\ & A\mathbf{x} \leq_K b \\ & (-A)\mathbf{x} \leq_K -b \end{aligned}$$

Standard form:

$$\begin{aligned} & \min_{\mathbf{z} \in \mathbb{R}^{\tilde{n}}} c^\top \mathbf{z} \\ \text{s.t. } & \mathbf{z} \geq_{\tilde{K}} 0 \\ & \tilde{A}\mathbf{z} = \tilde{b} \end{aligned}$$

$$\begin{aligned} & \mathbf{z} = [x_+; x_-; t] \\ & t = h - G(x_+ - x_-) \\ & A(x_+ - x_-) = b \end{aligned}$$

Linear Programming (LP)

$$\begin{aligned} \min_{\boldsymbol{x} \in \mathbb{R}^n} \quad & c^\top \boldsymbol{x} \\ \text{s.t.} \quad & G\boldsymbol{x} \leq h \\ & A\boldsymbol{x} = b \end{aligned}$$

Quadratic Programming (QP)

$$\begin{aligned} \min_{\boldsymbol{x} \in \mathbb{R}^n} \quad & \boldsymbol{x}^\top P\boldsymbol{x} + q^\top \boldsymbol{x} \\ \text{s.t.} \quad & G\boldsymbol{x} \leq h \\ & A\boldsymbol{x} = b \end{aligned}$$

Second Order Cone Programming (SOCP)

$$\begin{aligned} \min_{\boldsymbol{x} \in \mathbb{R}^n} \quad & c^\top \boldsymbol{x} \\ \text{s.t.} \quad & \|G_i \boldsymbol{x} - h_i\|_2 \leq q_i^\top \boldsymbol{x} + r_i \quad i = 1..m \\ & A\boldsymbol{x} = b \end{aligned}$$

Quadratically Constrained Quadratic Programming (QCQP)

$$\begin{aligned} \min_{\boldsymbol{x} \in \mathbb{R}^n} \quad & \boldsymbol{x}^\top P_0 \boldsymbol{x} + q_0^\top \boldsymbol{x} \\ \text{s.t.} \quad & \boldsymbol{x}^\top P_i \boldsymbol{x} + q_i^\top \boldsymbol{x} \leq r_i \quad i = 1..m \\ & A\boldsymbol{x} = b \end{aligned}$$

Semidefinite Programming (SDP)

$$\begin{aligned} \min_{\boldsymbol{x} \in \mathbb{R}^n} \quad & c^\top \boldsymbol{x} \\ \text{s.t.} \quad & G\boldsymbol{x} \leq h \\ & A\boldsymbol{x} = b \end{aligned}$$

Dual Cones and Generalized Inequalities

$$K^* = \{y \in (\mathbb{R}^k)^* \mid \forall_{x \in K} \langle y, x \rangle \geq 0\}$$

- For a proper cone (pointed cone with non-empty interior): $K^{**} = K$, i.e.

$$K^{**} = \{x \in \mathbb{R}^k \mid \forall_{y \in K^*} \langle y, x \rangle \geq 0\} = K$$

- Claim:

$$f_i(x) \leq_K 0 \Leftrightarrow \sup_{\substack{\lambda \in K^* \\ \lambda \neq 0}} \langle \lambda, f_i(x) \rangle \text{ must be } 0 \text{ or } \infty$$

$$\begin{matrix} K^* \\ \Downarrow \\ \lambda \end{matrix} \quad \begin{matrix} K \\ \Downarrow \\ f_i(x) \end{matrix}$$

- Proof of \Rightarrow : $\langle \lambda, f_i(x) \rangle = -\langle \lambda, -f_i(x) \rangle \leq 0$
- Proof of \Leftarrow : $\forall_{\lambda \in K^*} \langle \lambda, -f_i(x) \rangle \geq 0 \rightarrow -f_i(x) \in K^{**} = K$

Duality with Generalized Inequalities

$$\begin{aligned} \min_{\mathbf{x} \in \mathbb{R}^n} \quad & f_0(\mathbf{x}) \\ \text{s.t.} \quad & f_i(\mathbf{x}) \leq_{K_i} 0 \\ & h_i(\mathbf{x}) = 0 \end{aligned}$$

$$\begin{aligned} \max_{\lambda_i \in \mathbb{R}^{k_i}, \nu \in \mathbb{R}^p} \quad & g(\lambda, \nu) \\ \text{s.t.} \quad & \lambda_i \geq_{K_i^*} 0 \end{aligned}$$

$f_0: \mathbb{R}^n \rightarrow \mathbb{R} \cup \{\infty\}$ convex, $f_i: \mathbb{R}^n \rightarrow \mathbb{R}^{k_i}$ K_i -convex, $h_j: \mathbb{R}^n \rightarrow \mathbb{R}$ linear

- Can write primal as:

$$p^* = \inf_{\mathbf{x}} \sup_{\lambda_i \geq_{K_i^*} 0, \nu} f_0(\mathbf{x}) + \sum_{i=1}^m \langle \lambda_i, f_i(\mathbf{x}) \rangle + \sum_{j=1}^p \langle \nu_j, h_j(\mathbf{x}) \rangle$$

- Dual objective (as usual):

$$g(\lambda, \nu) = \inf_{\mathbf{x}} L(\mathbf{x}, (\lambda, \nu))$$

Duality with Generalized Inequalities

$$\begin{array}{ll} \min_{\mathbf{x} \in \mathbb{R}^n} & f_0(\mathbf{x}) \\ \text{s.t.} & f_i(\mathbf{x}) \leq_{K_i} 0 \\ & h_i(\mathbf{x}) = 0 \end{array}$$

$$\begin{array}{ll} \max_{\lambda_i \in \mathbb{R}^{k_i}, \nu \in \mathbb{R}^p} & g(\lambda, \nu) \\ \text{s.t.} & \lambda_i \geq_{K_i^*} 0 \end{array}$$

$f_0: \mathbb{R}^n \rightarrow \mathbb{R} \cup \{\infty\}$ convex, $f_i: \mathbb{R}^n \rightarrow \mathbb{R}^{k_i}$ K_i -convex, $h_j: \mathbb{R}^n \rightarrow \mathbb{R}$ linear

\mathbf{x}^* optimal for (P)
 λ^*, ν^* optimal for (D)

KKT Conditions

$$\begin{aligned} f_i(\mathbf{x}^*) &\leq_{K_i} 0 \quad \forall i=1..m \\ h_j(\mathbf{x}^*) &= 0 \quad \forall j=1..p \\ \lambda_i^* &\geq_{K_i^*} 0 \quad \forall i=1..m \\ \nabla_{\mathbf{x}} L(\mathbf{x}^*, (\lambda^*, \nu^*)) &= 0 \\ \text{or } 0 &\in \partial_{\mathbf{x}} L(\mathbf{x}^*, (\lambda^*, \nu^*)) \\ \langle \lambda_i^*, f_i(\mathbf{x}^*) \rangle &= 0 \quad \forall i=1..m \end{aligned}$$

Multi-Dimensional Objective

$$\begin{aligned} \min_{\boldsymbol{x} \in \mathbb{R}^n} \quad & f_0(\boldsymbol{x}) \\ \text{s.t.} \quad & f_i(\boldsymbol{x}) \leqslant_{K_i} 0 \\ & h_i(\boldsymbol{x}) = 0 \end{aligned}$$

$f_0: \mathbb{R}^n \rightarrow \mathbb{R}^k \cup \{\infty\}$ K -convex

$f_i: \mathbb{R}^n \rightarrow \mathbb{R}^{k_i}$ K_i -convex, $h_j: \mathbb{R}^n \rightarrow \mathbb{R}$ linear

- Minimization is w.r.t. cone K : We prefer x over x' if $f_0(x) \leqslant_K f_0(x')$
- Problem: might not be able to compare,
i.e. possible that $f_0(x) \leqslant_K f_0(x')$ but also $f_0(x') \leqslant_K f_0(x)$

Multi-Criteria Optimization

$$f_0(x) = [F_1(x) \ F_2(x) \ \dots F_k(x)] \in \mathbb{R}^k$$

- Optimization w.r.t. positive orthant, i.e. elementwise comparison
 $f_0(x) \leq_K f_0(x') \equiv f_0(x) \leq f_0(x') \equiv \forall_i (F_i(x) \leq F_i(x'))$

$$\begin{aligned} \min_{\mathbf{x} \in \mathbb{R}^n} \quad & F_1(\mathbf{x}), F_2(\mathbf{x}), \dots, F_k(\mathbf{x}) \\ \text{s. t.} \quad & f_i(\mathbf{x}) \leq_{K_i} 0 \\ & h_i(\mathbf{x}) = 0 \end{aligned}$$

$F_i: \mathbb{R}^n \rightarrow \mathbb{R} \cup \{\infty\}$ convex

$f_i: \mathbb{R}^n \rightarrow \mathbb{R}^{k_i}$ K_i -convex, $h_j: \mathbb{R}^n \rightarrow \mathbb{R}$ linear

Examples

- Maximizing expected return and minimizing risk
 n stocks with means $\mu \in \mathbb{R}^n$ and covariance S

$$\begin{aligned} \min_{\boldsymbol{x} \in \mathbb{R}^n} \quad & F_1(\boldsymbol{x}) = -\langle \mu, \boldsymbol{x} \rangle, \quad F_2(\boldsymbol{x}) = \boldsymbol{x}^\top S \boldsymbol{x} \\ \text{s.t.} \quad & \boldsymbol{x} \geq 0 \\ & \sum_{i=1}^n \boldsymbol{x}_i = 1 \end{aligned}$$

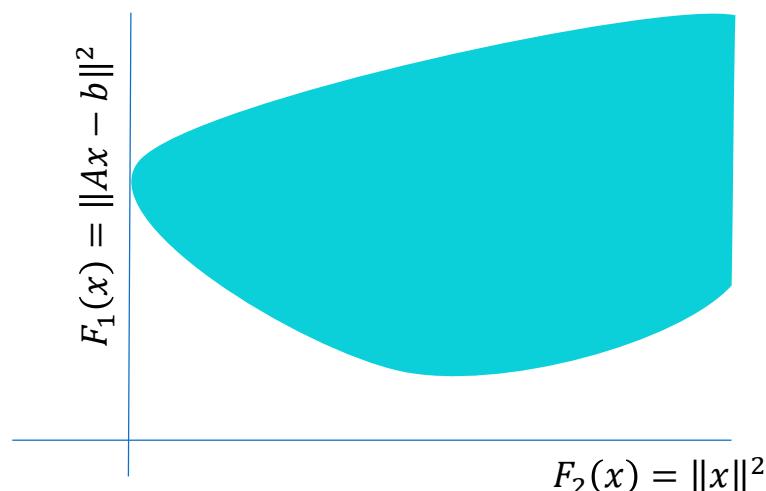

- Model fit and model complexity (regularization)

$$\min_{\boldsymbol{w} \in \mathbb{R}^n} \quad F_1(\boldsymbol{w}) = \|A\boldsymbol{w} - b\|_2^2, \quad F_2(\boldsymbol{w}) = \|\boldsymbol{w}\|_2^2$$

What is “Optimal”?

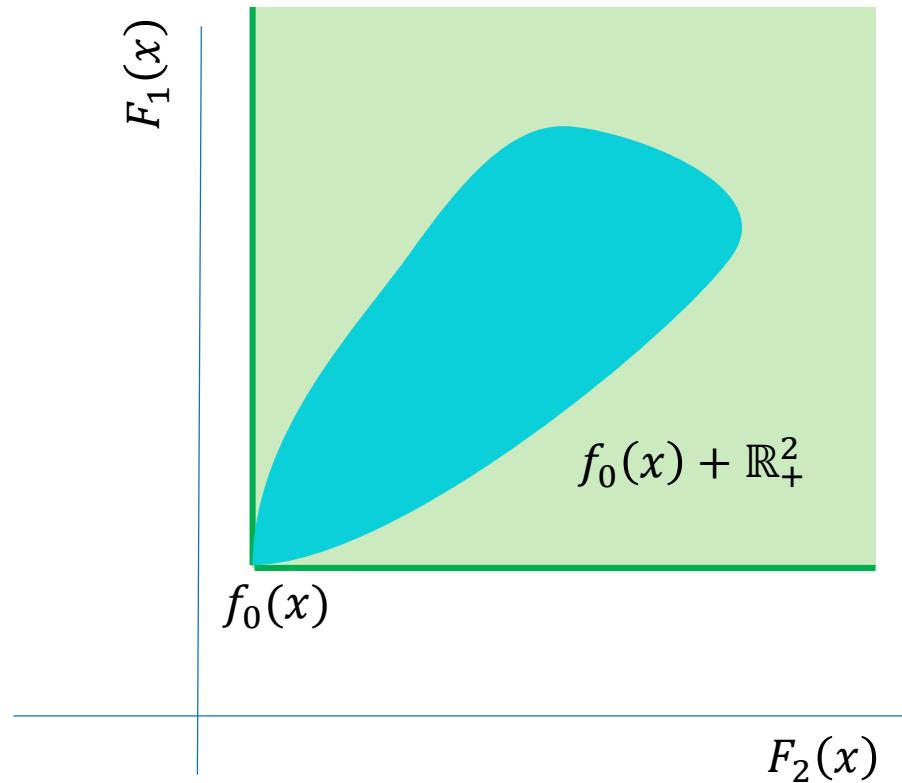

$$\begin{aligned} \min_{\mathbf{x} \in \mathbb{R}^n} \quad & f_0(\mathbf{x}) = [F_1(\mathbf{x}), F_2(\mathbf{x}), \dots, F_k(\mathbf{x})] \\ \text{s.t.} \quad & f_i(\mathbf{x}) \leq 0 \\ & h_i(\mathbf{x}) = 0 \end{aligned}$$

- Definition: A feasible x is **optimal** if \forall feasible y , $f_0(x) \leq f_0(y)$
i.e. if \forall feasible y , $\forall i$, $F_i(x) \leq F_i(y)$
- Set of attainable solutions: $\mathcal{O} = \{f_0(x) \mid x \text{ is feasible}\}$

When Does an Optimum Exist

- Definition: A feasible x is **optimal** if \forall feasible y , $f_0(x) \leq f_0(y)$
- Claim: A feasible x is optimal iff $\mathcal{O} \subseteq f_0(x) + \mathbb{R}_+^k$

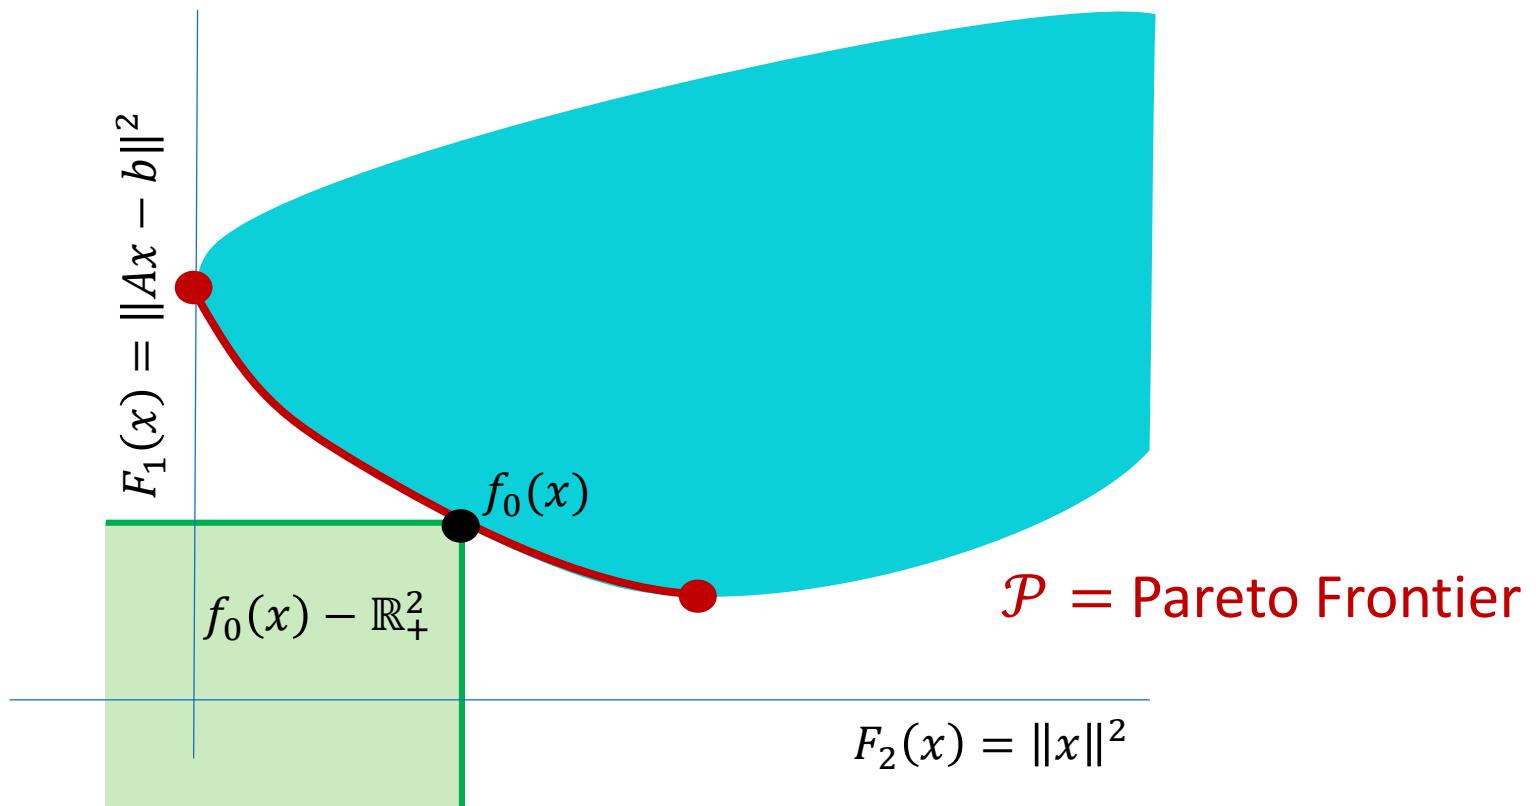

The Pareto Frontier

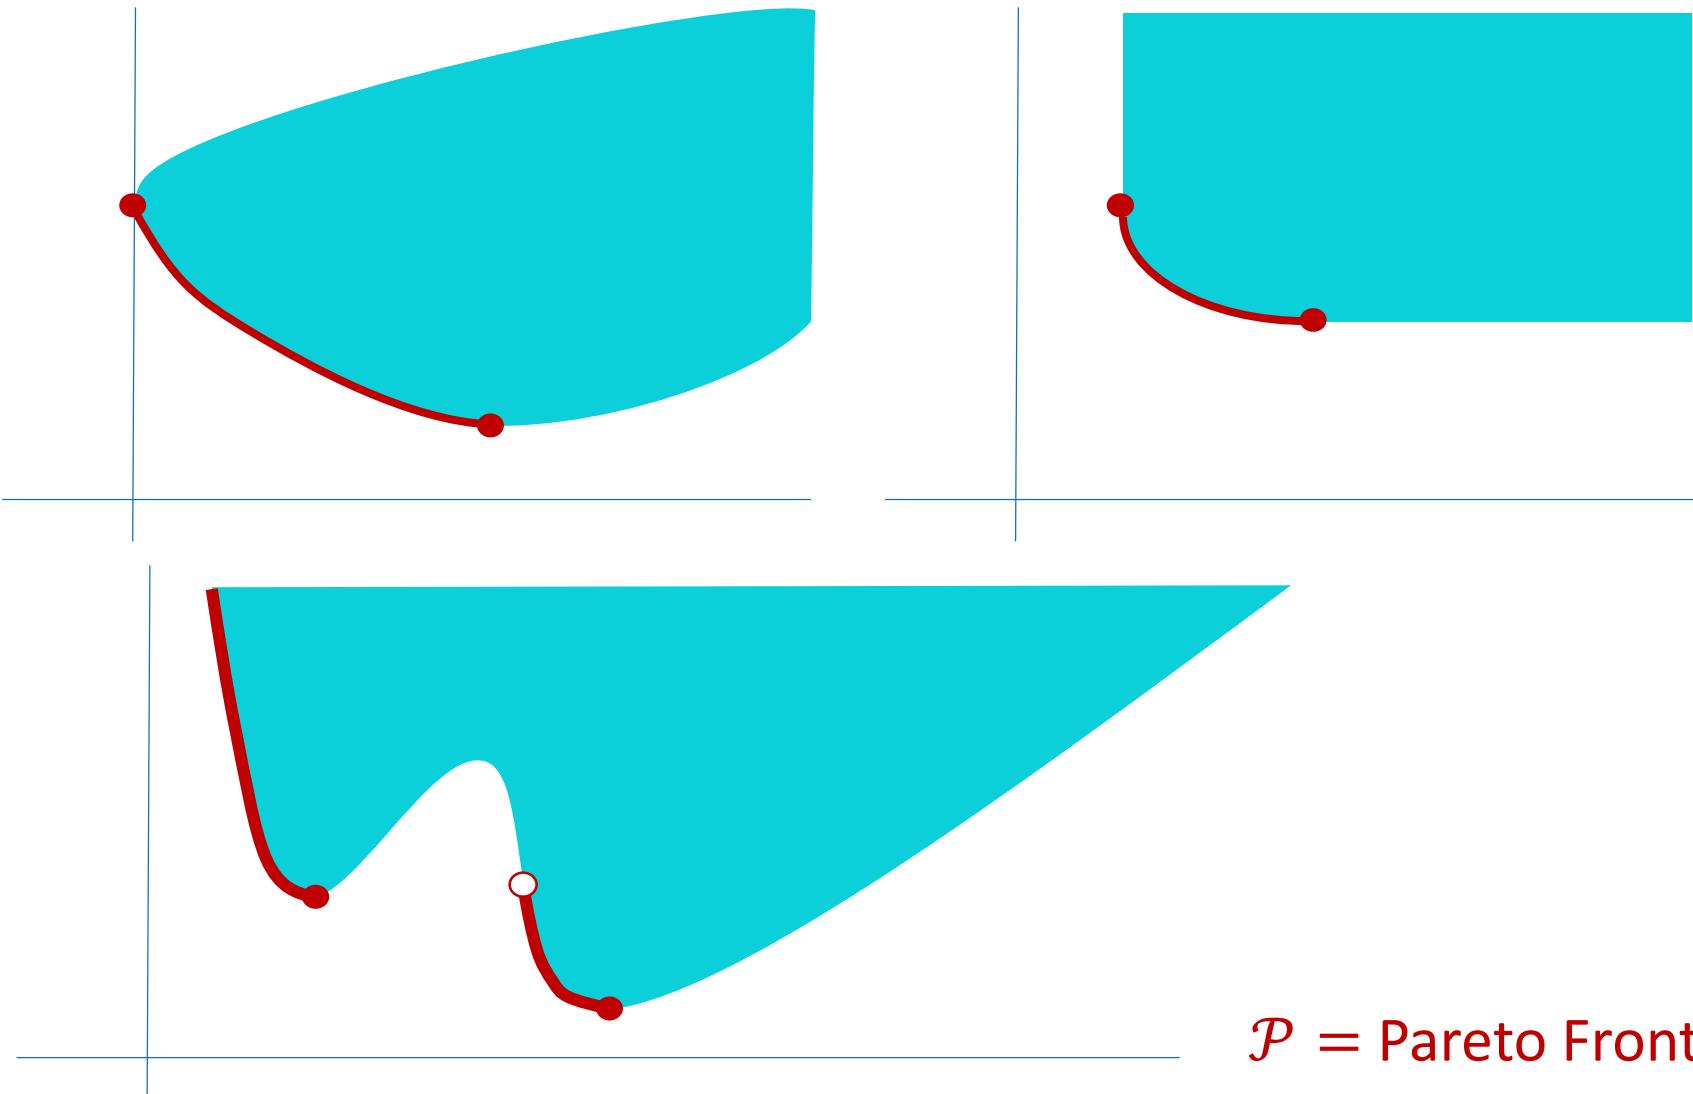

- Definition: A feasible x is **Pareto Optimal** iff

$$\forall \text{ feasible } y, f_0(y) \leq f_0(x) \rightarrow f_0(y) = f_0(x)$$

- Claim: A feasible x is Pareto Optimal iff $(f_0(x) - \mathbb{R}_+^k) \cap \mathcal{O} = \{f_0(x)\}$

Examples

\mathcal{P} = Pareto Frontier

Claim: for a convex optimization problem,

$\mathcal{O} + \mathbb{R}_+^n$ always convex and has same Pareto Frontier as \mathcal{O}

Scalarization

$$\begin{aligned} \min_{\mathbf{x} \in \mathbb{R}^n} \quad & f_0(\mathbf{x}) = [F_1(\mathbf{x}), F_2(\mathbf{x}), \dots, F_k(\mathbf{x})] \\ \text{s.t.} \quad & f_i(\mathbf{x}) \leq 0 \\ & h_i(\mathbf{x}) = 0 \end{aligned}$$

- For $\lambda = (\lambda_1, \lambda_2, \dots, \lambda_k) \geq 0$, introduce the problem:

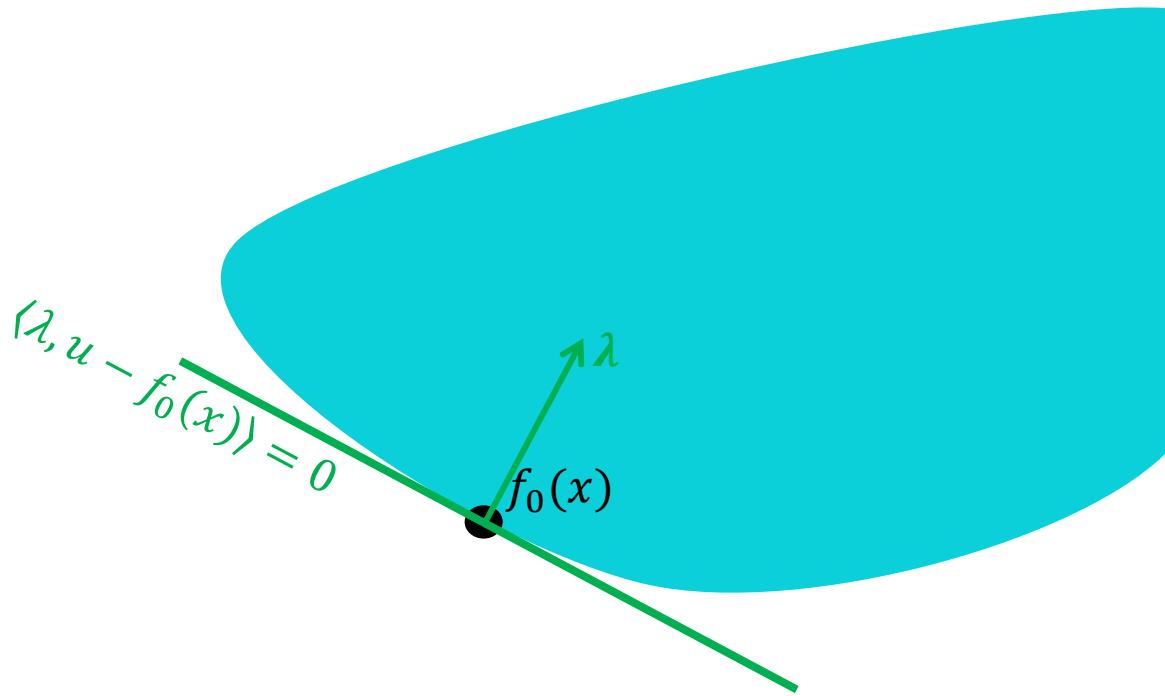

$$\begin{aligned} \min_{\mathbf{x} \in \mathbb{R}^n} \quad & \langle \lambda, f_0(\mathbf{x}) \rangle = \sum_{i=1}^k \lambda_i F_i(\mathbf{x}) \\ \text{s.t.} \quad & f_i(\mathbf{x}) \leq 0 \\ & h_i(\mathbf{x}) = 0 \end{aligned}$$

- Claim: for $\lambda > 0$, an optimum x_λ^* of the λ -problem is Pareto optimal
Proof: if $f_0(x) \leq f_0(x_\lambda^*)$ and better on at least one F_i , then $\langle \lambda, f_0(x) \rangle < \langle \lambda, f_0(x_\lambda^*) \rangle$

- Geometrically: $\forall_{y \text{ feasible}} \langle \lambda, f_0(x_\lambda^*) \rangle \leq \langle \lambda, f_0(y) \rangle$
 $\Rightarrow \forall_{u \in \mathcal{O}} \langle \lambda, f_0(x_\lambda^*) \rangle \leq \langle \lambda, u \rangle$
 $\Rightarrow \{u | \langle \lambda, u - f_0(x_\lambda^*) \rangle = 0\}$ is a supporting HP of \mathcal{O}

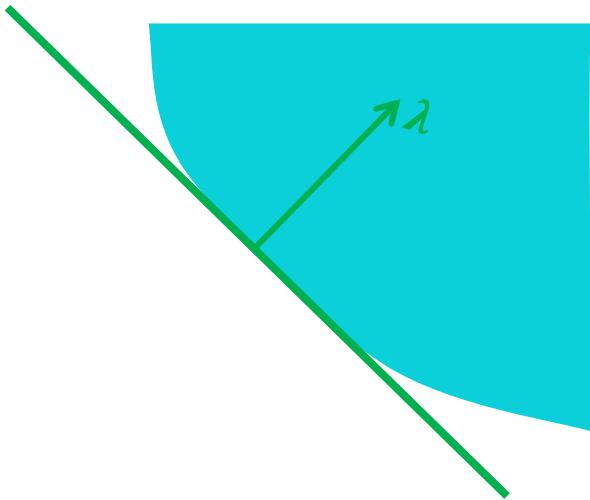

Scalarization

$$\begin{array}{ll} \min_{\boldsymbol{x} \in \mathbb{R}^n} & \langle \boldsymbol{\lambda}, f_0(\boldsymbol{x}) \rangle = \sum_{i=1}^k \lambda_i F_i(\boldsymbol{x}) \\ \text{s. t.} & f_i(\boldsymbol{x}) \leq 0 \\ & h_i(\boldsymbol{x}) = 0 \end{array}$$

$\{x_\lambda^* \text{ optimal for } \lambda - \text{problem} \mid \lambda > 0\} \subseteq \mathcal{P}$

Scalarization

Multiple Pareto optimal x_λ^* for same λ

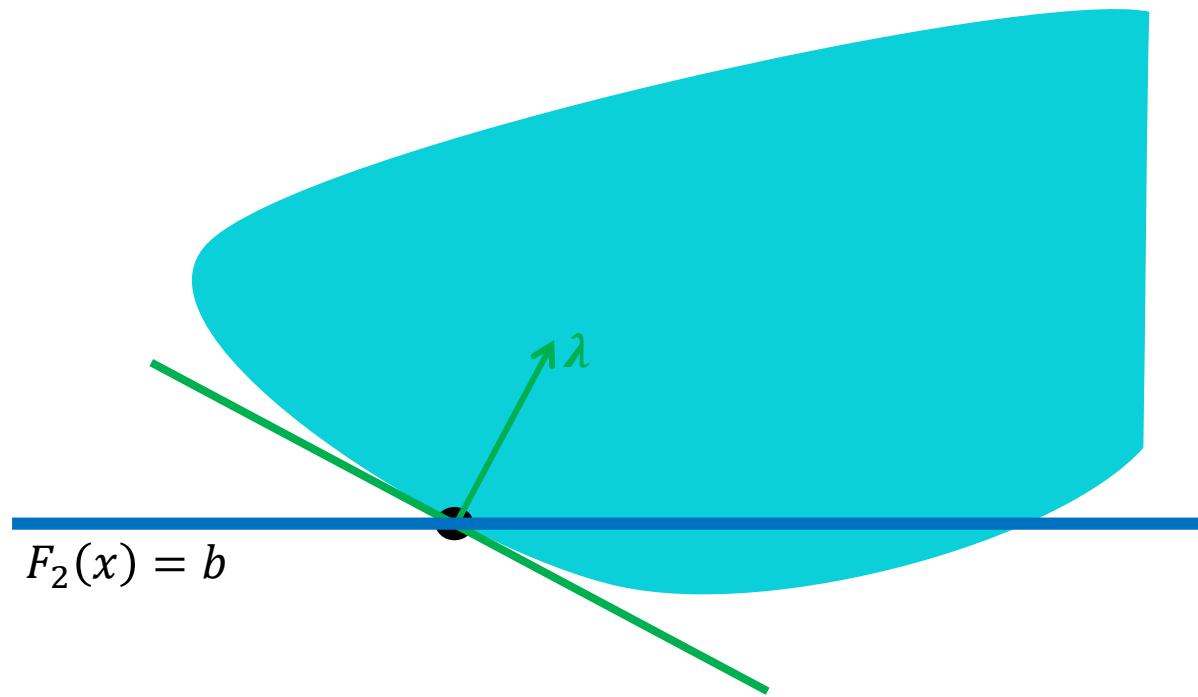

Not all x_λ^* for $\lambda = (1,0)$ and $\lambda = (0,1)$ are Pareto optimal

$$\begin{aligned} & \{ x_\lambda^* \text{ optimal for } \lambda - \text{problem} \mid \lambda > 0 \} \\ & \subseteq \mathcal{P} \subseteq \\ & \{ x_\lambda^* \text{ optimal for } \lambda - \text{problem} \mid \lambda \geq 0 \} \end{aligned}$$

Criteria as Constraints

$$\min_{\mathbf{x} \in \mathbb{R}^n} F_1(\mathbf{x}), F_2(\mathbf{x})$$

$$\begin{aligned} \min_{\mathbf{x} \in \mathbb{R}^n} \quad & F_1(\mathbf{x}) \\ \text{s.t.} \quad & F_2(\mathbf{x}) \leq b \end{aligned}$$

$$\min_{\mathbf{x} \in \mathbb{R}^n} F_1(\mathbf{x}) + \lambda F_2(\mathbf{x})$$

Optimization w.r.t. Cone K

$$\begin{aligned} \min_{\mathbf{x} \in \mathbb{R}^n} \quad & f_0(\mathbf{x}) \\ \text{s. t.} \quad & f_i(\mathbf{x}) \leqslant_{K_i} 0 \\ & h_i(\mathbf{x}) = 0 \end{aligned}$$

$f_0: \mathbb{R}^n \rightarrow \mathbb{R}^k \cup \{\infty\}$ K -convex

$f_i: \mathbb{R}^n \rightarrow \mathbb{R}^{k_i}$ K_i -convex, $h_j: \mathbb{R}^n \rightarrow \mathbb{R}$ linear

- Definition: A feasible x is **optimal** if \forall feasible y , $f_0(x) \leqslant_K f_0(y)$
- Claim: A feasible x is optimal iff $\mathcal{O} \subseteq f_0(x) + K$
- Definition: A feasible x is **Pareto Optimal** iff
 \forall feasible y , $f_0(y) \leqslant_K f_0(x) \rightarrow f_0(y) = f_0(x)$
- Claim: A feasible x is Pareto Optimal iff $(f_0(x) - K) \cap \mathcal{O} = \{f_0(x)\}$

Scalarization for K -Optimization

$$\begin{aligned} \min_{\mathbf{x} \in \mathbb{R}^n} \quad & f_0(x) \\ \text{s.t.} \quad & f_i(\mathbf{x}) \leqslant_{K_i} 0 \\ & h_i(\mathbf{x}) = 0 \end{aligned}$$

- For $\lambda \geqslant_K 0$, introduce the problem:

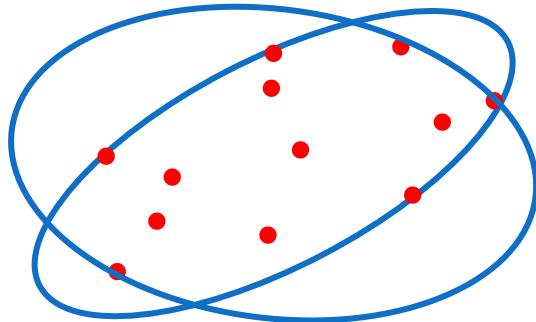

$$\begin{aligned} \min_{\mathbf{x} \in \mathbb{R}^n} \quad & \langle \lambda, f_0(x) \rangle \\ \text{s.t.} \quad & f_i(\mathbf{x}) \leqslant_{K_i} 0 \\ & h_i(\mathbf{x}) = 0 \end{aligned}$$

- Claim: for $\lambda >_K 0$, an optimum x_λ^* of the λ -problem is Pareto optimal

$$\lambda \in \text{interior}(K)$$

$$\begin{aligned} \{ x_\lambda^* \text{ optimal for } \lambda - \text{problem} \mid \lambda >_K 0 \} \\ \subseteq \mathcal{P} \subseteq \\ \{ x_\lambda^* \text{ optimal for } \lambda - \text{problem} \mid \lambda \geqslant_K 0 \} \end{aligned}$$

Matrix Optimization: Example

- Find *minimal* encompassing ellipsoid of $a_1, a_2, \dots, a_m \in \mathbb{R}^n$ (i.e. encompassing ellipsoid that isn't a superset of any other encompassing ellipsoid)

$$\begin{array}{ll}\min_{X \in S^n} & (-X) \\ \text{s.t.} & a_i^T X a_i \leq 1 \quad i = 1..m\end{array}$$

Optimization is w.r.t. the semi-definite cone (matrix inequality)
